

What is Codeshot

Codeshot is an app that turns your code into a snapshot.

- Website: <https://codeshotapp.com/>
- App Store: <https://apps.apple.com/us/app/codeshot/id1541665460>

Who is this app for

Codeshot is for Developers or anyone who needs to shares code snippets on social media or presentations.

What makes it different from others

I create this mainly as a way to learn Apple Catalyst technology and scratch my own itch. Most solutions out there don't support custom sizing. With Codeshot, I can set size like Twitter size and see a frame of the result in real-time, so I know exactly how it looked like when export <https://twitter.com/sarunw/status/1337254674097872897>

Without that real-time sizing, I might end up with not perfect align image like this <https://twitter.com/sarunw/status/1335705547367215109>

And there are some others that I think it's better than others.

Ease of use - Core features are accessible from keyboard shortcuts. You can finish the whole process with the slightest touch of your mouse.

Customizable - Window corner radius. - Monospace fonts from your system. - Background color. - Drop shadow position. - Padding and margin.
